Color Meter for Automotive Industry

One of the most important mobility products - function, design and color. In nowadays automotive production, parts come from all over the world. There is a massive mixture of metals, plastics, wood, paper, ceramics ... There is a primary group of suppliers for the car production itself and a worldwide network for the aftersales and repair parts market. Therefore all parts have to have an absolute identical color - all colors must be harmonised (identical) to meet the customers requirements. To have the best correlation between the measurements in all locations in the world, all parties involved in the automotive parts production chain and even all those involved in the repair parts market should use exactly the same type of color meter or the same working principle.
